

Data Management & Exchange Ltd

Strategic information management consultancy

Information management is about getting the right information to the right people at the right time.

You make crucial business decisions based on the information you have available. If that information is incomplete, unreliable, or inaccessible, how can those decisions be the best ones for your business?

The information your business has is one of its major assets, but storing this information is simply a drain on resources if you cannot make use of it to give you the edge over your competitors.

Good Information management makes your business more competitive.

- It will reduce the final data size (and associated storage costs).
- It will increase efficiency in the workplace.
- It will add quality to the decision process.

How do we at DMXL go about helping to give you that competitive edge?

1. We review your current information storage, workflows, and business processes.
Information management is an integral part of your business process. We will go through your current business processes and workflow with you and see how your information storage systems fit into the overall business.
2. We analyse and design improved systems.
Based on our findings we will design a new system to enable your business to make best use of the latest technologies, including helping you to use these technologies to improve the workflow within your business.
3. We migrate your existing information into the new system.
We will work with you to determine what data you need in the new system, and what can be archived. We will then take the required data in all it's various formats and migrate it into the new system.
4. We help you verify and quality assure your data.
You don't want to migrate unreliable information. This is the time to validate your data. We will ensure that only reliable information is migrated to the new system. This data cleanup process is one of the most underrated benefits of updating your information management systems.

A recent study by a major oil company found that for a typical project, over 33% of the time is spent gathering and formatting the data required to actually do the work. By introducing a good information management system, they have now reduced that to less than 20%, effectively reducing project costs by nearly 15%.

Time saved by good information management = increased profit
